

Medication Reminders

The medication reminder module allows for outbound dialing campaigns to assigned residents/patients, notifying them to take their medication.

With this module, staff can manage medication requirements within a building by a simple click of a mouse.

Features of this module include: easy to read reports; failed delivery notifications; and unique recorded messages for individual residents/patients.

Our medication reminder module offers flexibility by providing three notification campaign formats:

- 1) Message delivery
- 2) Message delivery with confirmation
- 3) Message delivery with confirmation and option to be transferred to nurse/doctor

The medication reminder module is used in conjunction with the apoloDS™ or ICS™ voice messaging system.

Key Features

Provides outbound notification to resident/patient

Three different campaigns are available to fit various scenarios

Three system default messages for easy integration and consistency

Staff may record customized messages for individual residents/patients

Retry attempts reduce risk and ensure the medication reminder is delivered
